Reducing the Risk of Surgeries for Pets with Pre-Anesthetic Testing
Every member of your family deserves the best medical care. At the International Center for Veterinary Services, we practice the best medicine possible to ensure a positive outcome and to minimize any risks during surgery, dental cleanings and all other anesthesia procedures for all pets.
Pre-Anesthetic and Complete Blood Count tests can help to determine that your pet is fit for surgery, providing pet owners with peace of mind.
Pre-Operation (Pre-Anesthetic) Biochemistry Test The Pre-Operation biochemistry blood test helps provide useful indicators of the health and function of your pet's organ systems, specifically detecting organ dysfunctions of the liver and kidneys. Dehydration and low glucose reserves are also highlighted, alerting your veterinarians to conditions that may predispose your pet to anesthetic complications.
Complete Blood Count (CBC) Test

The Complete Blood Count (CBC) is a hematology test that provides a detailed look at blood cells. Red Blood Cell results provide information regarding oxygen-carrying ability, while White Blood Cell results provide information about how well your pet can fight infection. Platelet results indicate how effectively your pet is able to stop bleeding.
